

REDI-ROCK RETAINING WALLS

SFC Engineering Partnership, Inc., (SFC) has been contracted by J&R Precast to provide design services for Redi-Rock block retaining walls for over 50 projects since 2005.

Projects have ranged from simple, 6-foot high landscape walls, to 30-foot high retaining walls. SFC has designed walls of several levels, walls with steep slopes, and walls with traffic and building loads, and designs have included seawalls, tight sites, curving walls, and free-standing walls. Owners represent single-family residential, commercial properties, and municipal sites.

Each site requires a unique design based on site conditions and loading. SFC's extensive knowledge of the diversity of Redi-Rock wall possibilities, along with our experience with a variety of site conditions and loading, makes us eminently qualified to design Redi-Rock retaining walls.
